*Poland syndrome*

### Congenital Breast Anomalies

Parents have many questions when they learn that their child has a congenital difference. Often these differences may cause significant psychosocial stress to the patient and family. Our specialists have an interest in breast reconstruction for pediatric patients who are born with asymmetry, underdeveloped or overdeveloped structures, or missing structures. Care of the pediatric and adolescent patient requires consideration of further growth and development. At our clinic, we take special care to consider all aspects of the diagnosis and to assess future growth and the entire psychosocial picture that presents.

### Pediatric Team Approach

In assessing patients with congenital breast anomalies, often a multidisciplinary approach is needed. Our surgeons consider this when evaluating the anomaly. Typically, each patient has a slightly different anomaly and every different option for reconstruction is discussed. Each plan of care is individualized for each patient by clinicians experienced in caring for children and adolescents.
